The Sino-US trade tensions continued to dominate the headlines in the last few quarters. Despite heightened volatility, the MSCI World Index delivered an outperformance of 15% year-to-date (Chart A), further cheered by optimism from the ongoing trade negotiations. While the global market is slowly digesting a potential trade war ceasefire, Trump called for a delisting of Chinese companies on the US stock exchanges in September, sending renewed jitters that trade disputes may be flowing over into the capital markets. The U.S. House also passed a bill to support the pro-democracy protesters in Hong Kong, further teasing the already fragile U.S.-China relations.

The Sino-US trade tensions continued to dominate the headlines in the last few quarters.

The impact of the longstanding trade spat is beginning to show up in the health of global manufacturing. Consecutive weak manufacturing data in several major economies has been observed and the worst US purchasing manager's index in a decade signals a contraction in the manufacturing sector, fanning yet another round of recessionary fears (See Chart B).

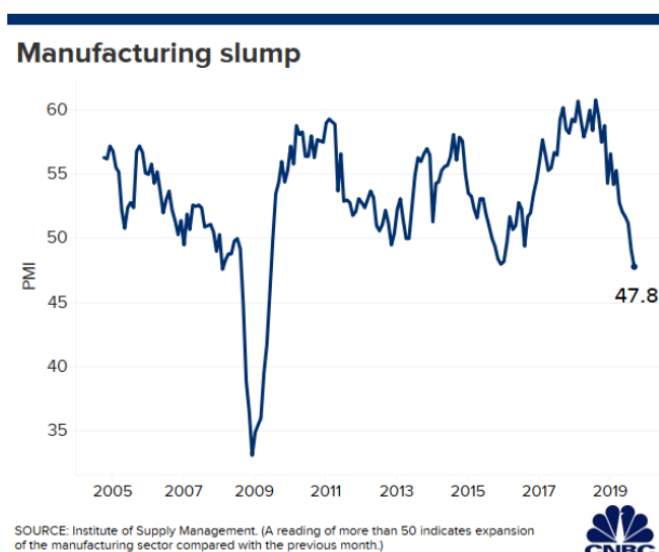

Back in mid-August, the brief yield curve inversion spooked the global market. An inverted yield curve occurs when short-term interest rates exceed long-term rates. While an inversion is widely regarded as a leading indicator of an upcoming recession, it does not *always* lead to recessions. If history is any indication, in the past 7 recessions, the inversions preceded the eventual downturn by an average of 22 months, according to Credit Suisse. The volatilities observed in August demonstrated a classic case of a self-fulfilling prophecy.

MSCI World Index Performance, YTD (Chart A)

US Manufacturing Slump (Chart B)

Source: Institute of Supply Management, October 2019

Despite a historical unemployment rate low of 3.6% and the inflation target in check, the Federal Reserve was still held at gunpoint by the market to embark on a rate cut cycle in July and another subsequent cut in September. Its European counterpart ECB also announced its first round of rate cut since 2011 and a renewed package of quantitative easing - with no deadline. These gave rise to a distorted bond market - the current inventory of negative-yielding bonds globally has swelled to more than \$17 trillion.

Volatilities are here to stay, hinging on global trade sentiments and Brexit. The market remains watchful on the developments of the trade negotiations and *how and when* Boris Johnson will be leading his country out of the EU. Despite the murkier outlook, we do not foresee a major downturn this year, as recessionary risks may be buoyed by central banks across the US, Europe and China, which are increasingly pressured to be more aggressive in easing. However, we remain cautious as the global market may experience a further slowdown in the wake of the prolonged trade tensions - unless there are meaningful upside surprises to the dismal manufacturing data, sustained global growth and promising resolutions to the trade rows.

It is our hope that this publication assists you, our clients, in your investment process for the rest of 2019.

Looking for Income and Stability? Why Investors Need to Expand Their Tool Kit

While a steady income sounds appealing, having a stable portfolio is just as important with memories of the market's large swings in May still fresh in investors' minds. However, with falling bond yields and the risk of a trade war just a tweet away, investors will likely need to expand their repertoire of asset classes to achieve the twin goal of income and stability.

There are multiple sources of income, so investors need not limit themselves to just one or two. A combined approach can be a more optimal way to help mitigate the various challenges within different income producing asset classes.

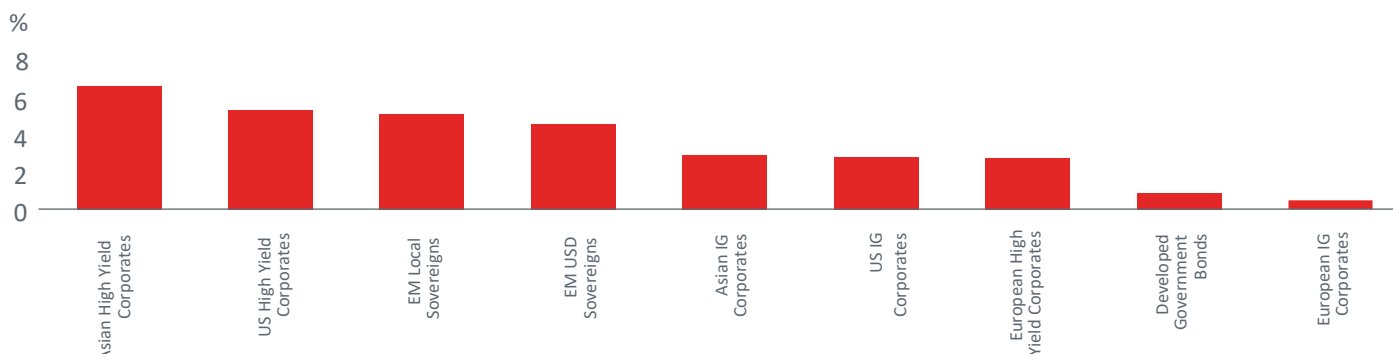

Bonds have traditionally been a source of income and stability. As bond yields have fallen lower and even reached negative levels in some countries, investors have gravitated towards higher yielding bonds including high yield bonds and emerging market debt (EMD). These bonds however come with higher volatility compared to investment grade bonds.

The market value of bonds trading at negative yields reached a new record of USD13.7tn¹. At the same time, the average yield of the global bond market has fallen from 2.51% in November last year to around 1.64%². With global central banks poised to loosen monetary policy further to counter the slowing global economy and address weak inflation, rates look likely to remain low for longer.

Against this backdrop, it is no surprise that Asian and US high yields have been popular with investors. The Asian high yield bond market has grown six-fold since 2005, providing investors with greater choice. As of end June, the average yield on Asian high yields is around 7.4%, higher than US and European high yields. See Fig. 1. Credit fundamentals have also been supportive - the average annual default rate for Asian high yield corporates of 2.3% is also significantly lower than other high yield markets³.

Furthermore, the Federal Reserve's rate cut in July gives Asian central banks flexibility to reduce rates, which is potentially supportive of the bond market. That said, given the more challenging growth conditions in Asia and globally, our Singapore fixed income team has turned more selective. While still finding opportunities within Asian high yields, they are also paring exposures in bonds with higher liquidity risks or which may face higher spillover risks arising from the US-China trade conflict.

Fig. 1: Asian high yields still offering highest yields⁴

Over in the US, US high yields' returns in the first half of 2019 (10% in USD terms) have been the strongest since 2016. Two-thirds of the returns came from price gains, a feat that looks unlikely to be repeated in the second half of the year. Nevertheless, the average yield on US high yields is still attractive around 6%, although it is down from 8% at the start of the year. Meanwhile, given above average valuations and slowing US corporate profits, investors need to consider credit quality and liquidity factors more carefully when accessing the US high yield space⁵.

Look Beyond High Yields

In looking for income from bonds, investors may not want to ignore EMD. After all, EMD represents a near USD20 trillion universe, or about half of the non-US debt market. With increasingly diverse issuers currently offering average yields of 5-6%⁶, EMD potentially offers investors another attractive source of income. That said, in-depth bottom-up research would be needed to navigate the vast and diverse universe. Returns from EMD also tend to be more volatile over shorter (1-year) holding periods. Bonds, however, are not the only assets that offer income. Dividends (from stocks) have also historically been a reliable source of income. In Asia, dividends make up more than 40% of total returns from stocks in the last ten years. This is higher than the share in the US (25%) and Japan (28%). Only Europe is superior, with dividends contributing to 47% of total returns over the same period⁷

And there is room for more dividends in Asia with companies currently paying out 36% of their earnings in dividends, below the 47% average of developed markets⁸. There has also been increasing diversification - Asian dividend payers are no longer restricted to utility or telecom companies. Our Singapore equity income team are currently finding opportunities in the financials, information technology and real estate sectors.

Beyond just income, dividend paying Asian stocks also offer potential capital gains. An index of high dividend yielding Asian stocks have historically outperformed its broader benchmark over the last 10 years. See Fig. 2. Interestingly, research by MSCI showed that high dividend yielding stocks in the emerging markets outperform their developed market peers as investors regard stable income to be a safe harbour against local economic and currency risks. That said, stock-level research with a focus on cash flow and dividend sustainability would be required to identify true winners.

The Whole is Greater Than The Sum of Its Parts

A combined approach provides flexibility to shift exposures between the different income producing asset classes in response to the changing economic and market environment. The various income producing assets have different correlations to US Treasuries (See Fig. 3) and at the same time, US/Asian High Yields appear to fare better in a risk-on environment. As such, lower yielding but less volatile Treasuries and investment grade bonds can play an important role in helping to stabilize a portfolio of income producing assets, especially during periods of high market volatility.
